

PUZZLE

UNIT I: Introduction

"The Python Code Labyrinth"

You are given a labyrinth of code snippets, each representing a different Python concept covered in Unit I. Your task is to navigate through the labyrinth by choosing the correct code snippet to solve a series of problems.

Objective: Start with a simple Python program and progressively modify it by selecting the correct code snippet that implements conditionals, loops, and variable manipulations. Each correct choice leads you closer to the exit, while incorrect choices loop you back to earlier stages. Can you reach the exit by successfully integrating all the Python basics?
