

A decorative pattern of overlapping blue circles is located on the left side of the slide. The circles are arranged in a grid, with each circle overlapping its neighbors, creating a repeating geometric design.

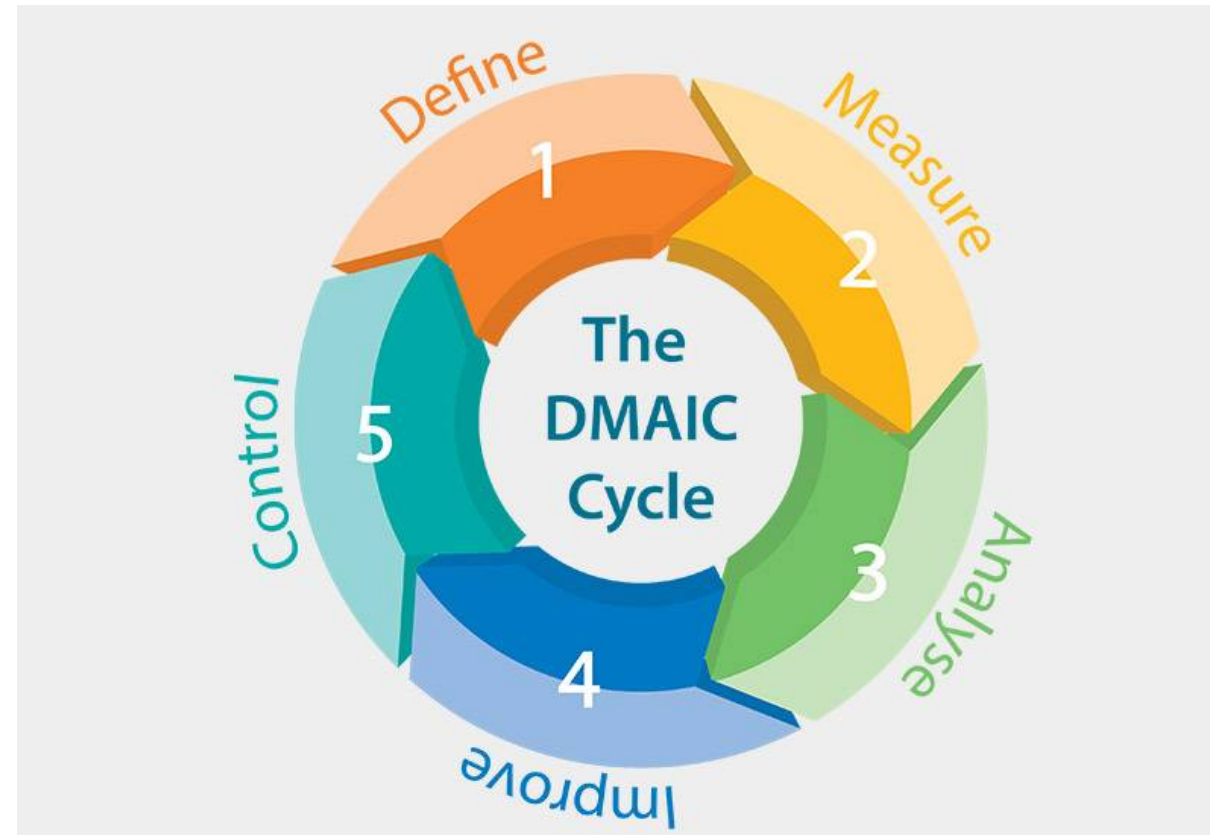

# SIX-SIGMA APPLICATION IN TIRE- MANUFACTURING COMPANY A CASE STUDY

---

K.M.EAZHIL  
ASSISTANT PROFESSOR  
DEPARTMENT OF MECHANICAL ENGINEERING

# WHY SIX SIGMA

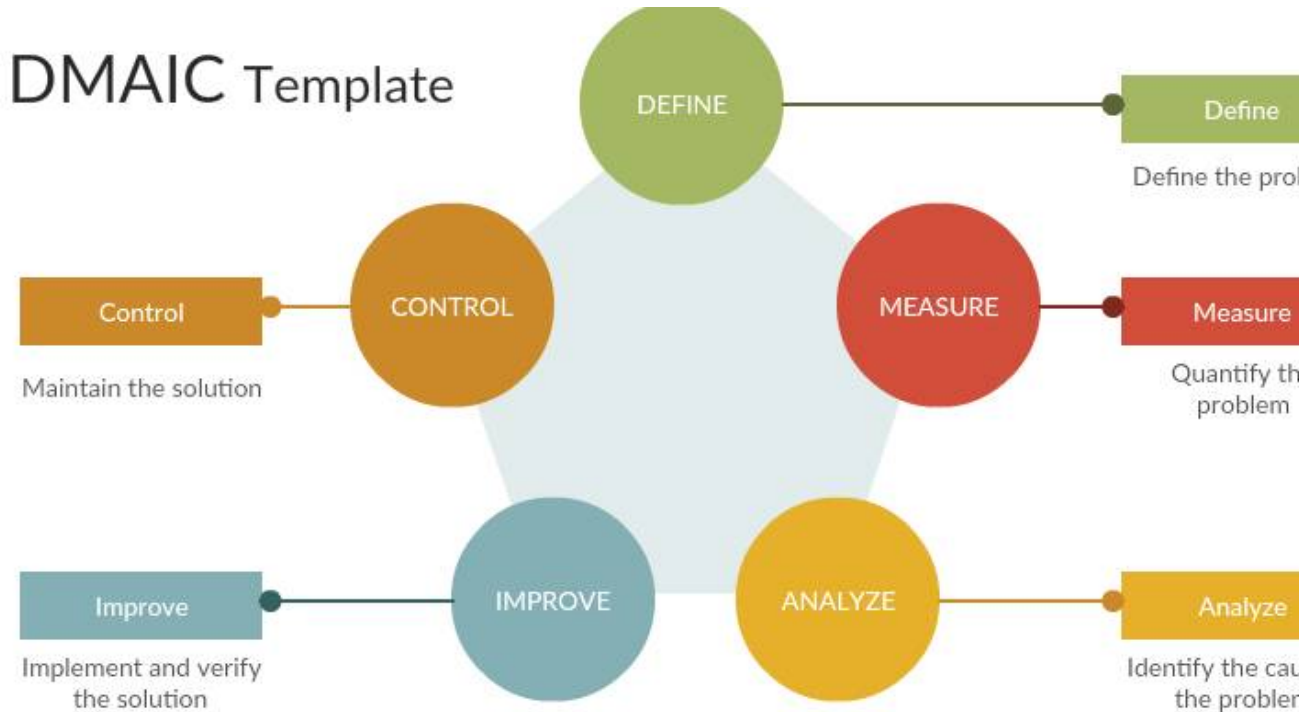

- To overcome the barriers
- Six Sigma Approach –DMAIC
- The DMAIC model is very similar to the PDCA (Plan-Do-Check-Act) or PDSA (Plan-Do-Study-Act)

# DMAIC- PROCESS

- problem identification –in define
- gathering the specification data – in measure
- six sigma quality tools-in analysis and improvement steps
- process control charts- in control

## DMAIC Template

# COMPANY PROFILE

- Company A was the leading Indian tire manufacturing who started exclusive branded outlets of truck tire
- company established a special tubes plant in the year 1996
- In year 2004, company initiated production of high-speed rated tubeless radial tires for passenger cars.

# IMPLEMENTATION OF DMAIC METHODOLOGY

- Problem definition
- Establishment of measures
- Data analysis
- Improve
- Control

Main specification range of bead splice to be produce

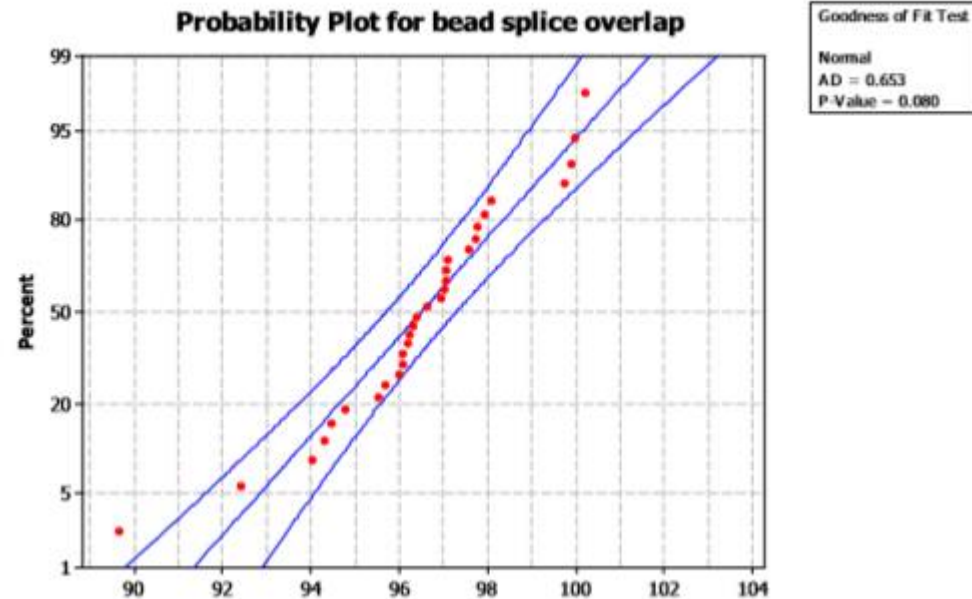

90 ± 15 mm

Average bead splice of tire

97 mm

Material loss due to Shifting of Splice from Target Specification

93–100 kg/m

### Run chart of bead splice

Number of runs about median:	20	Number of runs up or down:	49
Expected number of runs:	38.5	Expected number of runs:	49.7
Longest run about median:	20	Longest run up or down:	3
Approx P-Value for Clustering:	0.000	Approx P-Value for Trends:	0.427
Approx P-Value for Mixtures:	1.000	Approx P-Value for Oscillation:	0.573

## Process Capability of Bead Splice - After Improvement

# CONCLUSION AND DISCUSSION

- to improve the value of process performance, the root causes of problem were determined with the help of cause and effect diagram
- in the improve phase, statistical analysis was done for identifying the process capability index
- it can be concluded that process performance of a tire-manufacturing plant can be improved significantly by implementing six-sigma DMAIC methodology
