Kurumbapalayam (Po), Coimbatore - 641 107

An Autonomous Institution

Accredited by NBA – AICTE and Accredited by NAAC – UGC with 'A' Grade
Approved by AICTE, New Delhi & Affiliated to Anna University, Chennai

DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

**COURSE NAME : 23CST101 C PROGRAMMING AND DATA
STRUCTURES
I YEAR / II SEMESTER**

Unit 1- C PROGRAMMING FUNDAMENTALS- A REVIEW

Topic 15 : Pointer: Pointer operation-Pointer arithmetic

Brain Storming

1. How to access memory location?

- **Hint: `int a=5;`**
- Single storage location is allotted for 5 in a variable “a”.
- How to access memory location?

Pointer

- The pointer in C language is a variable which stores the address of another variable.
- This variable can be of type int, char, array, function, or any other pointer.
- The size of the pointer depends on the architecture.
- **However, in 32-bit architecture the size of a pointer is 2 byte.**

Example

- `int *a;`//pointer to int
- `char *c;`//pointer to char

```
int a = 44;   int *b;   b = &a;
```

44		Address of a	44
a	*b	b	*b

b is pointer to an integer. b is pointing to a or b stores the address of a *b is value at b (address of a)

C - Pointers

```
int var = 10;
int *p;
p = &var;
```

P is a pointer that stores the address of variable var.
The data type of pointer p and variable var should match because an integer pointer can only hold the address of integer variable.

Pointer Operator

Operator	Operator Name	Purpose
*	Value at Operator	Gives Value stored at Particular address
&	Address Operator	Gives Address of Variable

Example program

```
#include<stdio.h>
int main()
{
int number=50;
int *p;
p=&number; // or int *p=&number
printf("Address of p variable is %x
\n",p);
printf("Value of p variable is %d
\n",*p);
return 0;
}
```

OUTPUT:

Address of p variable is fff4
Value of p variable is 50

Address Of (&) Operator

- The address of operator '&' returns the address of a variable.
- But, we need to use %u to display the address of a variable.

Example...

```
#include<stdio.h>
int main(){
int number=50;
printf("value of number is %d,
address of number is
%u",number,&number);
return 0;
}
```

Output

```
value of number is 50,
address of number is fff4
```

NULL Pointer

- A pointer that is not assigned any value but NULL is known as the NULL pointer.
- If you don't have any address to be specified in the pointer at the time of declaration, you can assign NULL value.
- **`int *p=NULL;`**

Pointer Arithmetic

- Following arithmetic operations are possible on the pointer in C language:
- Increment
- Decrement
- Addition
- Subtraction
- Comparison

Incrementing Pointer in C

- If we increment a pointer by 1, the pointer will start pointing to the immediate next location.
- This is somewhat different from the general arithmetic since the value of the pointer will get increased by the size of the data type to which the pointer is pointing.
- The Rule to increment the pointer is given below:
- **`new_address = current_address + i * size_of(data type)`**

Conti...

Where i is the number by which the pointer get increased.

32-bit:

For 32-bit int variable, it will be incremented by 2 bytes.

64-bit:

For 64-bit int variable, it will be incremented by 4 bytes.

Let's see the example of incrementing pointer variable on 64-bit architecture.

```
#include<stdio.h>
int main(){
int number=50;
int *p;//pointer to int
p=&number;//stores the address of number variable
printf("Address of p variable is %u \n",p);
p=p+1;
printf("After increment: Address of p variable is %u \n",p); // in our
case, p will get incremented by 4 bytes.
return 0;
}
```

Output

- Address of p variable is 3214864300
- After increment: Address of p variable is 3214864304

- **This is similar for Decrementing Pointer**
- Address of p variable is 3214864300
- After Decrement: Address of p variable is 3214864296

Traversing an array by using pointer

```
#include<stdio.h>
void main ()
{
    int arr[5] = {1, 2, 3, 4, 5};
    int *p = arr;
    int i;
    printf("printing array elements...\n"
);
    for(i = 0; i < 5; i++)
    {
        printf("%d ",*(p+i));
    }
}
```

OUTPUT:
printing array
elements...
1 2 3 4 5

C Pointer Addition

- We can add a value to the pointer variable. The formula of adding value to pointer is given below:
- **$\text{new_address} = \text{current_address} + (\text{number} * \text{size_of}(\text{data type}))$**
 - **32-bit**
 - For 32-bit int variable, it will add $2 * \text{number}$.
 - **64-bit**
 - For 64-bit int variable, it will add $4 * \text{number}$.

Let's see the example of adding value to pointer variable on 64-bit architecture.

```
#include<stdio.h>
int main(){
int number=50;
int *p;          //pointer to int
p=&number;      //stores the address of number variable
printf("Address of p variable is %u \n",p);
p=p+3;         //adding 3 to pointer variable
printf("After adding 3: Address of p variable is %u \n",p);
return 0;
}
```

Output

- Address of p variable is 3214864300
- After adding 3: Address of p variable is 3214864312

- This is similar for Pointer Subtraction
- Address of p variable is 3214864300
- After subtracting 3: Address of p variable is 3214864288

Illegal arithmetic with pointers

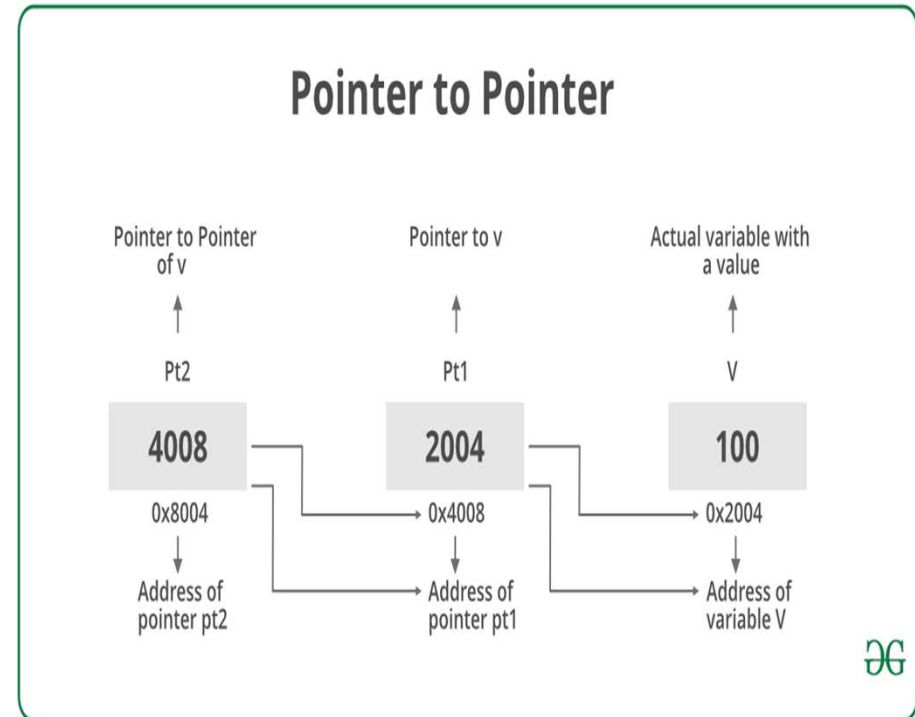

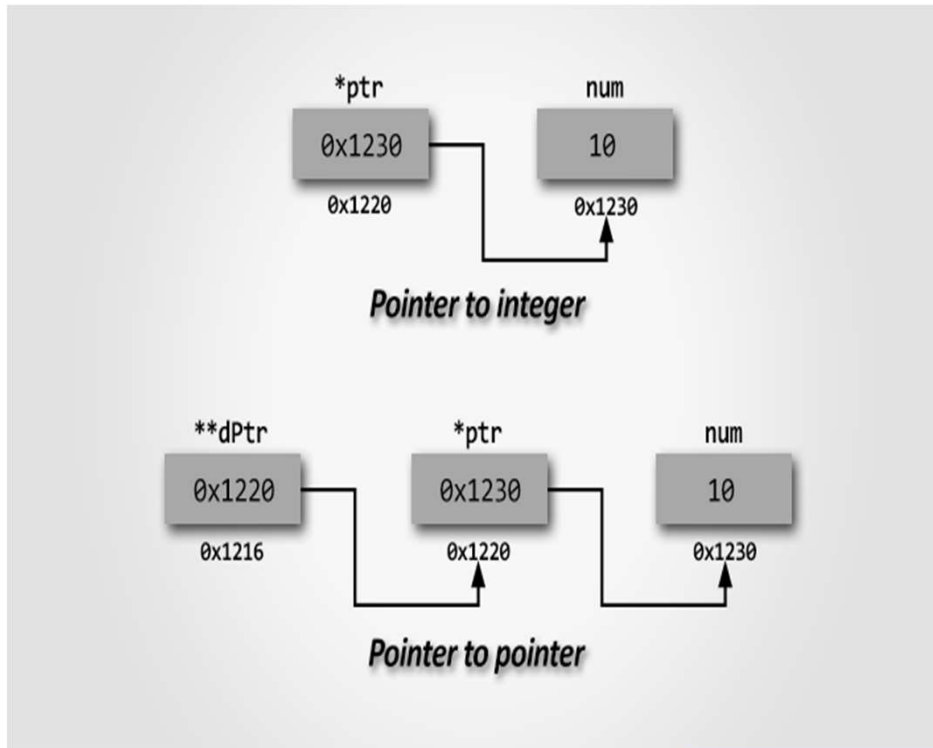

- Address + Address = illegal
- Address * Address = illegal
- Address % Address =
illegal
- Address / Address = illegal
- Address & Address =
illegal
- Address ^ Address = illegal
- Address | Address = illegal
- ~Address = illegal

Pointer to Pointer / Double Pointer

- A pointer to a pointer is a form of multiple indirection, or a chain of pointers.
- Normally, a pointer contains the address of a variable.
- When we define a pointer to a pointer, the first pointer contains the address of the second pointer, which points to the location that contains the actual value as shown below.

Example...

```
#include <stdio.h>

int main () {

    int var;
    int *ptr;
    int **pptr;

    var = 3000;

    /* take the address of var */
    ptr = &var;

    /* take the address of ptr using address of operator & */
    pptr = &ptr;

    /* take the value using pptr */
    printf("Value of var = %d\n", var );
    printf("Value available at *ptr = %d\n", *ptr );
    printf("Value available at **pptr = %d\n", **pptr);

    return 0;
}
```

OUTPUT

```
Value of var = 3000
Value available at *ptr = 3000
Value available at **pptr = 3000
```

Example 1:

Pointers and

ays

```
#include <stdio.h>
int main() {
    int i, x[6], sum = 0;
    printf("Enter 6 numbers: ");
    for(i = 0; i < 6; ++i) {
        // Equivalent to scanf("%d", &x[i]);
        scanf("%d", x+i);

        // Equivalent to sum += x[i]
        sum += *(x+i);
    }
    printf("Sum = %d", sum);
    return 0;
}
```

```
Enter 6 numbers: 2
3
4
4
12
4
Sum = 29
```

Example 1:

Pointers and

Arrays

$\&x[1]$ is equivalent to $x+1$ and $x[1]$ is equivalent to $*(x+1)$.

$\&x[2]$ is equivalent to $x+2$ and $x[2]$ is equivalent to $*(x+2)$.

...

Basically, $\&x[i]$ is equivalent to $x+i$ and $x[i]$ is equivalent to $*(x+i)$.

Example 2: Pointers and Arrays

```
#include <stdio.h>
int main() {
    int x[5] = {1, 2, 3, 4, 5};
    int* ptr;

    // ptr is assigned the address of the third element
    ptr = &x[2];

    printf("*ptr = %d \n", *ptr);    // 3
    printf("*(ptr+1) = %d \n", *(ptr+1)); // 4
    printf("*(ptr-1) = %d", *(ptr-1)); // 2

    return 0;
}
```

```
*ptr = 3
*(ptr+1) = 4
*(ptr-1) = 2
```

Assessment 1

1. What is pointer?

Ans : _____

2. Write about pointer arithmetic operations ?

Ans : _____
